Storyboard

Persona: Marissa. College freshman at Santa Clara University. Outdoorsy, into rock climbing. Comfortable with everyday tech (messaging, maps, phone calls). Plans a main activity but loves filling free time with spontaneous exploration. Wants to be present, not glued to her phone.

Storyboard:

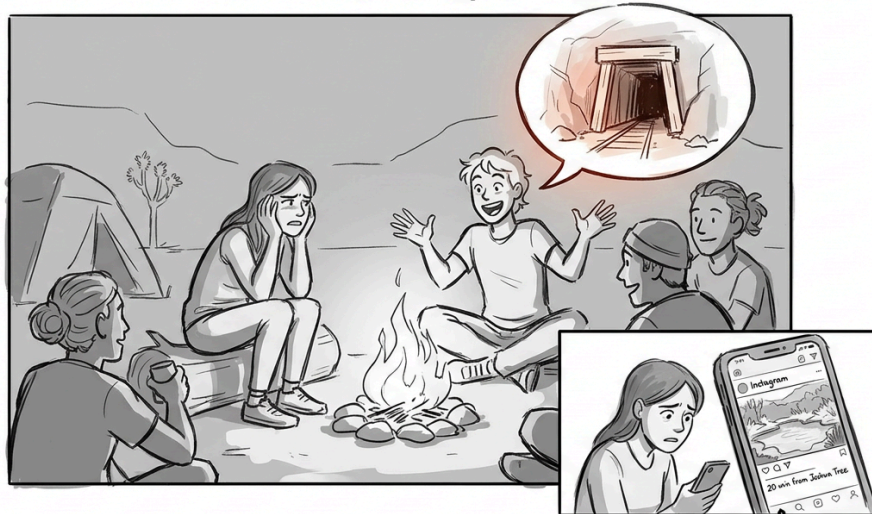

Marissa, 18 — college freshman, climber, explorer.
Heading to Joshua Tree for a weekend climbing trip.

Frame 2: The Problem

Curious about what she's passing, but can't find out. Stops to search — maps only show the obvious.

Frame 3: The Oh Crap Moment

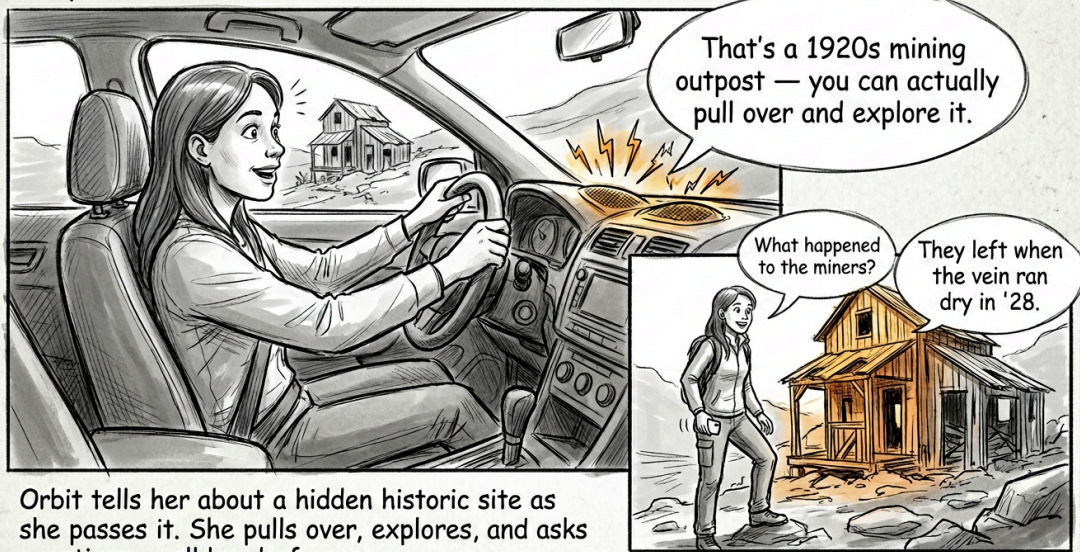

Her friend found an incredible abandoned mine — right off Marissa's route. She drove right past it. **The discovery always comes too late.**

Orbit Enters

A friend shows her Orbit — effortless discovery, no pre-planning needed. Marissa downloads it before her next trip.

Storyboard Frame 5: "The Aha Moment"

Orbit tells her about a hidden historic site as she passes it. She pulls over, explores, and asks questions — all hands-free.

Phone in pocket. Eyes up. Present. Marissa explores with confidence — she's become the friend who always finds the hidden gems.

Prototype Differentiator:

My prototype focuses on the auditory experience of traveling. It aims to act as a "knowledgeable and friendly tour guide in your pocket." The vision I see for using this product could be nearly entirely screen-free. The user could be driving down a long stretch of road and be engaged by the audio conversation. When the user is walking through a new town, they can get quick

suggestions and learn more about what is around them, while spending less time looking down at their phone.
